

Weekly journal digest for 2026-05-04 to 2026-05-10

Summary, highlights, collection snapshot, and full curated digest

Summary

weekly brief

COMAP Journal Bot reviewed 251 collected candidates for the 2026-05-04 to 2026-05-10 digest window. After manual relevance filtering, the curated digest keeps 50 papers: 23 new this week, 24 previous-week catch-up items, and 3 late additions.

This is a high-signal week for computational media and political communication. The strongest thread runs from dataveillance and chilling effects to TikTok's partisan recommendation skews, Russian wartime rhetoric on social media, multilingual survey-response classification, and the legal limits of DSA-style platform research access.

- Political communication is especially strong: surveillance, identity threat, campaign affect, persuasive media discussion, social media rhetoric, and platform access all appear in the same week.
- Methods pieces focus on text-as-behavior, multilingual open-ended survey classification, digital trace sequences, genetic confounding in observational studies, and higher-order network structure.
- Broad-science keeps were filtered toward social inequality, democratic norms, misinformation, AI reliability, scientific visibility, climate and environmental policy, and public-risk behavior.

Highlights

7 priority papers

Focused on New This Week.

1 Dataveillance inhibits legitimate communication: causal evidence for chilling effects

Journal of Communication | 2026-05-05

Why it matters: This is the week's clearest fit for COMAP: causal evidence that surveillance expectations can chill legitimate communication, directly relevant to censorship, platform governance, and political expression.

2 Systematic partisan content skews in TikTok during the 2024 US elections

Nature | 2026-05-06

Why it matters: A large sock-puppet audit of TikTok during the 2024 US election gives unusually direct evidence on algorithmic curation, partisan exposure, and platform power.

Exploring temporal dynamics in digital trace data: mining user-sequences for communication research 2026-05-09 Yangliu Fan; Jakob Ohme; Lion Wedel

Affiliations: Institute for Media and Communication Studies, Freie Universitat Berlin; Weizenbaum Institute

DOI: 10.1080/19312458.2026.2664873

Link: [Open article](#)

Abstract: Communication is commonly considered a process that is dynamically situated in a temporal context. However, there remains a disconnection between such theoretical dynamicality and the non-dynamical character of communication scholars' preferred methodologies. In this paper, we argue for a new research framework that uses computational approaches to leverage the fine-grained timestamps recorded in digital trace data. In particular, we propose to maintain the hyper-longitudinal information in the trace data and analyze time-evolving 'user-sequences,' which provide rich information about user activity with high temporal resolution. To illustrate our proposed framework, we present a case study that applied six approaches (e.g., sequence analysis, process mining, and language-based models) to real-world user-sequences containing 1,262,775 timestamped traces from 309 unique users, gathered via data donations. Overall, our study suggests a conceptual reorientation towards a better understanding of the temporal dimension in communication processes, resting on the exploding supply of digital trace data and the technical advances in analytical approaches.

A Longitudinal and Dyadic Study of Communal Coping and Relational Turbulence Among Surviving Parents and Emerging Adult Children After the Death of a Partner/Parent

2026-05-09 | Hannah E. Jones; Jennifer A. Theiss

Affiliations: Rutgers University, New Brunswick, NJ, USA; University of Kentucky, Lexington, USA

DOI: 10.1177/00936502261449286

Link: [Open article](#)

Abstract: The death of a parent/partner represents a significant and traumatic transition for surviving families. Guided by relational turbulence theory, this longitudinal and dyadic study examines how relationship characteristics in surviving parent-emerging adult child dyads correspond with communal coping and relational turbulence during bereavement. Data were collected from 45 parent-emerging adult child dyads for 6 weeks. Results highlight relational uncertainty and interdependence as factors that shape cognitive, emotional, and communicative features of coping episodes. Communal coping behaviors, when enacted, emerged as a protective mechanism, helping mitigate relational turbulence. Actor-partner effects demonstrated the interdependent nature of coping and relational turbulence. This study extends relational turbulence theory to parent-child relationships and underscores the importance of communal coping during transitions. Practical implications suggest the need to help families enact coping and manage interdependence during bereavement to mitigate relational turbulence and improve relationship outcomes.

Political Identity Threats on Social Media

2026-05-08 | Daniel S. Lane; Yifei Wang; Alcides Velasquez

Affiliations: University of California, Santa Barbara, USA; University of Kansas, Lawrence, USA

DOI: 10.1177/00936502261443863

Link: [Open article](#)

Abstract: One appealing explanation for the dismal state of digital politics in the U.S. is that social media offer abundant threats to users' political identities. This paper provides a theoretical and empirical foundation for studying political identity threats on social media. A pilot study (N = 931) established that individuals can recognize both realistic and symbolic threats when they explicitly appear in TikTok videos, but that, (a) threat types are not as discrete as theory suggests and (b) sensitivity to symbolic threat depends on strength of partisan identity. A second, pre-registered experimental study (N = 1,279) found that the presence of explicit threats to political ingroups/outgroups influenced emotions and willingness to engage politically on social media. These effects were mediated by threat recognition and often larger for those with stronger partisan identities. This research sets an agenda for studying the presence and effects of explicitly identity-threatening social media content.

Examining the Effects of Viewing Positive Aging TikTok Videos on Aging Outcomes and Attitudes Among Young, Middle-Aged, and Older Women

2026-05-07 | R. Amanda Cooper; Lexi McNamara; Heather Gahler

Affiliations: University of Connecticut, Storrs, USA; University of Wisconsin La Crosse, USA

DOI: 10.1177/00936502261442688

Link: [Open article](#)

Abstract: This experiment tests the communicative ecology model of successful aging (CEMSA) to determine how viewing positive aging TikTok videos impacts aging outcomes for young (n = 306), middle-aged (n = 225), and older (n = 100) women.

n = 233) women. We also extend the CEMSA to include ageism and positive attitudes toward older adults. Watching positive aging TikTok videos had an indirect effect on aging efficacy through positive aging affect for all age groups. There was also a positive indirect effect on successful aging through positive affect and aging efficacy for middle-aged and older women. For all three age groups, viewing positive aging TikTok videos increased positive attitude toward older adults through positive affect about aging. Watching positive aging videos was not associated with aging uncertainty in any group. Additional associations and implications for the CEMSA and attitudes toward older adults are discussed.

Shaping Interpersonal Communication About Persuasive Media Campaigns by Inducing Critical Versus Collective Orientations

2026-05-07 | Shu Scott Li; James Price Dillard

Affiliations: The Pennsylvania State University, University Park, USA; University of Akron, OH, USA

DOI: 10.1177/00936502261441102

Link: [Open article](#)

Abstract: Individuals process persuasive campaign messages intra- and interpersonally with the goal of either accurately evaluating the advocacy or defending against it. In an experiment, messages that argued for reducing consumption of sugar-sweetened beverages were presented to regular drinkers (N = 275). They were then forbidden to interact, allowed to interact, or directed to interact by discussion prompts with either a critical or a collective focus. The no-talk condition data showed persuasion whereas unguided talk yielded counter-persuasion (i.e., a boomerang), which was mitigated to an equal degree by the two prompts. Exploration of potential mediating mechanisms revealed that the prompt effects could be attributed to variations in the quantity of on-topic talk, sentence length, cognitive process words, and negations. As all of these findings were strongest among heavy drinkers, the study demonstrated the promise of prompts for promoting campaign-consistent talk and salutary effects among at-risk individuals.

Angry and Alerted, Happy and Informed? An Experience Sampling Study on the Relationship Between Sentiment, Affect, and Attention Toward Campaign Communication

2026-05-06 | Lukas P. Otto; Fabian Thomas; Michaela Maier

Affiliations: GESIS - Leibniz Institute for the Social Sciences, Cologne, Germany; RPTU Kaiserslautern Landau, Germany

DOI: 10.1177/00936502261443864

Link: [Open article](#)

Abstract: This study examines how emotional reactions to campaign communication relate to attentional processes and, ultimately, to general interest in a political campaign. Drawing on appraisal theories of emotion and the broaden-and-build theory, we argue that emotional responses to political communication play a central role in shaping different forms of attention and elaboration. Specifically, emotions may foster a narrow attentional focus directed at the stimulus itself or a broader attentional orientation characterized by a willingness to seek additional information. To test these assumptions, we conducted a mobile experience sampling study during the 40 days preceding the 2021 German federal election. Participants repeatedly reported the perceived sentiment of campaign communication, their emotional reactions while encountering it, and their attentional focus toward political information immediately after exposure to campaign communication. Between-person analyses indicate that both negative affect (particularly anger) and positive affect are associated with attentional processes, while happiness is specifically linked to a broadened attentional focus. At the within-person level, both negative and positive emotions predicted momentary attentional focus. Campaign interest, however, was related to (situational) attention rather than to affective processes. We conclude by discussing the role of positivity and positive affect in research on political media effects.

Text as Behavior

2026-05-06 | Omar Wasow

Affiliations: University of California, Berkeley

DOI: 10.1017/pan.2026.10041

Link: [Open article](#)

Abstract: Abstract Text analysis typically focuses on content-such as sentiment or topic-but expression is also a form of effortful action. Building on this insight, I propose using simple features of open-ended tasks to study text as behavior. This approach treats expression, such as writing, as cognitively, emotionally and temporally "costly" for subjects but inexpensive for researchers. I show basic statistics like the number of characters can approximate effort and significantly improve estimation of quantities of interest, including candidate choice, the probability of turning out to vote and psychological states about which a subject may not be fully aware. Further, these methods can convert nonresponse into informative data; validate survey instruments; serve as mechanism checks; be hard for a subject to "game"; work across different languages and analogize well to real-world situations. In sum, text as behavior can help address a range of issues related to quantifying attitudes and actions.

Democracy Manifest or Democracy Latent? A Unified Framework for Identifying Regime Types and Transitions

2026-05-05 | Omer Faruk Orsun; Muhammet A. Bas

Affiliations: New York University Abu Dhabi

DOI: 10.1017/pan.2026.10042

Link: [Open article](#)

Abstract: Abstract Regime types and transitions are central to a wide range of political phenomena. Reflecting this importance, prior research has produced a variety of regime measures. This diversity, however, comes with important challenges for applied research: selecting a measure among many options, having to define regime categories based on cut-offs, identifying regime transitions by specific magnitudes of change over a specific time window and dealing with measurement uncertainty and missing data. In this article, we introduce Unified Transitions and Stability (UNITAS), a new framework that offers a solution to these challenges. Combining information from commonly used regime indicators, this approach identifies regime types and transitions probabilistically, locates the most likely periods of regime transitions and incorporates measurement uncertainty. Through Monte Carlo simulations, we demonstrate the desirable properties and robustness of UNITAS under various scenarios. In an illustrative application, we show that stable semi-democracies are not inherently conflict-prone and that autocratization is consistently associated with higher civil war risk while democratization is not.

Using Multilingual Language Technology to Classify Open-Ended Survey Responses: Conceptions of Democracy in a Cross-Cultural Survey Setting

2026-05-04 | Stefan Dahlberg; Luise Durlich; Sofia Axelsson; Yahui Zhao; Joakim Nivre

Affiliations: Centrum voor Wiskunde en Informatica; Mid Sweden University; RISE Research Institutes of Sweden AB; University of Bergen; University of Gothenburg; Uppsala University

DOI: 10.1017/pan.2026.10043

[Link: Open article](#)

Abstract: Abstract Recent advancements in language technology have opened new avenues in political science for automating and improving survey data analysis across diverse cultural contexts. This article examines the effectiveness of language models (LMs) in analyzing open-ended survey responses about democracy from ten countries, contrasting these modern tools with traditional survey methodologies. Utilizing a predefined coding scheme and a subset of pre-annotated survey data, it assesses the performance of fine-tuning pre-trained LMs in a multilingual setting to classify text spans. The findings suggest that LMs can capture democratic perceptions and handle data abstractions at levels comparable to human annotators. This study not only highlights the potential of LMs to transform political science research by augmenting traditional methods but also discusses the practical applications of pre-trained LMs in classifying complex survey responses, in collaboration with human annotators.

Vote buying and negative agenda control: A problem for the study of money in politics

2026-05-05 | Andre Van Parys

Affiliations: Department of Political Science University of Rochester Rochester USA

DOI: 10.1111/ajps.70063

[Link: Open article](#)

Abstract: Abstract Politicians, pundits, and ordinary citizens frequently argue that money has an outsized influence on US politics. Yet research on the effect of money on politicians' behavior finds limited effects, especially on voting behavior. I construct a formal model to show that these limited effects may be an artifact of the institutional powers of agenda setters, and the strategic nature of the data generating process. The model predicts that, under general conditions, vote buying against proposals can occur with no vote held, and that vote buying is most likely when uncertainty is high, the interest group and agenda setter are extreme, and the pivotal legislator is moderate. I argue that these conditions held during the 2021 negotiations over the Build Back Better Act. Using a synthetic control design, I test whether the swing voters in the Senate received more campaign contributions than they would have otherwise, finding evidence consistent with the model.

Procedural Polarization: How Election Rules Shape Voters' Confidence

2026-05-05 | JOSHUA D. CLINTON

Affiliations: Vanderbilt University

DOI: 10.1017/s000305542610166x

[Link: Open article](#)

Abstract: Prior research demonstrates voters' confidence in elections depends on whether their preferred candidate wins, but does agreement with the electoral rules being used also matter? Leveraging growing procedural polarization in election laws, public opinion data from 2008 to 2024, and a large-scale survey experiment conducted before the 2024 election, I show that agreement with election procedures matters for voter confidence beyond well-established effects related to partisan control and electoral outcomes. Observational and experimental analyses consistently reveal that voters are less likely to express confidence in election results conducted using procedures they oppose.

The effects are particularly large for voter identification laws and among Republicans and independents. The findings underscore a tension in American federalism: as states increasingly adopt divergent electoral rules aligned with co-partisan preferences, partisan divides in electoral confidence may deepen. If so, procedural responsiveness to partisan preferences may undermine electoral confidence and, in turn, perceptions of electoral legitimacy.

Dataveillance inhibits legitimate communication: causal evidence for chilling effects

2026-05-05 | Noemi Festic; Moritz Buchi; Michael Latzer; Celine Odermatt

Affiliations: Department of Communication and Media Research, University of Zurich , Zurich,; Institute of Applied Media Studies, ZHAW Zurich University of Applied Sciences , Winterthur,

DOI: 10.1093/joc/jqag004

Link: [Open article](#)

Abstract: Abstract Chilling effects are an undesirable consequence of the datafication of communication: people may refrain from entirely lawful online activities due to fear of negative repercussions based on their digital traces. Our preregistered, longitudinal online field experiment randomly exposed 827 participants to accounts of dataveillance at 19 prompts across six weeks. Within individuals, this reduced comfort with online opinion sharing, information seeking, and information disclosure. Across individuals, greater total exposure was not robustly associated with lower comfort. Women, older, and less-educated participants reported lower overall comfort, with no evidence of sociodemographic moderation of chilling effects. Follow-up focus groups validated these results. Our study advances chilling effects theory and contributes causal evidence for dataveillance-induced self-censorship in a representative sample. The implications of this subtle relinquishing of autonomy are relevant for individual well-being and democratic participation in societies increasingly shaped by dataveillance.

A universal scaling law of intra-urban inequality

2026-05-09 | Conghong Huang; Xiaodan Liu; Shibin Zhang; Zongyang Jin; Nan Xu; Weixin Ou

DOI: 10.1038/s41467-026-73015-1

Link: [Open article](#)

Abstract: Abstract Large-scale urban agglomeration yields economic benefits but often coincides with pronounced environmental and social disparities. While aggregate urban attributes follow predictable scaling laws, how intra-urban inequality scales with city size remains unclear. To bridge this gap, we analyze over 11,000 global urban centers using multi-source satellite data to quantify inequalities in thermal exposure, green space, and economic activity. Here we show that all three dimensions follow super-linear scaling laws with city population size. Specifically, a doubling of city population is associated with an approximately 8-9% higher inequality Gini coefficient. Furthermore, these scaling relationships are significantly modulated by national socioeconomic development and background climate: green space and economic inequalities exhibit steeper scaling in low-income nations, whereas thermal inequality scales most acutely in arid climates. Consequently, achieving equitable urban development requires targeted interventions rather than relying on passive scale effects.

Proactive collaboration via autonomous interaction

2026-05-09 | Peiyan Li; Shuyuan Zhang; Wenju Yang; Yitong Hu; Yuhang Wang; Dunzheng Wang; Hang Li; Di Guo; Huaping Liu

DOI: 10.1038/s41467-026-72797-8

Link: [Open article](#)

Abstract: Human teams excel at dynamically restructuring both task assignments and team composition in response to emerging challenges, proactively recruiting or releasing members as needed. This capacity for autonomous adaptation is a cornerstone of effective teamwork, yet remains difficult to achieve in heterogeneous multi-robot systems, which typically operate under fixed team configurations or adapt only responsively to external disruptions. In this work, we present a systematic investigation of the Proactive Collaboration paradigm for robot teams, where the working team autonomously recruits or releases members as tasks evolve. We implement this paradigm by equipping robots with the developed Autonomous Interaction framework, which utilizes need-driven multi-round communication to facilitate discussions over task progress, negotiated task allocation, and dynamic team resizing. Through real-world and simulated experiments, we demonstrate that our framework effectively realizes the Proactive Collaboration. By resolving capability gaps via anticipatory planning and minimizing action redundancy, it yields consistent and measurable gains in team efficiency and robustness. Our findings suggest that enabling individual-level initiative may offer a promising pathway toward more adaptive and cohesive collective behavior in multi-robot systems.

Short-term action is key for gigaton-scale Direct Air Capture by 2050

2026-05-09 | Tatjana Zurbruggen; Nicoletta Brazzola; Adrian Odenweller; Falko Ueckerdt; Joeri Rogelj

DOI: 10.1038/s41467-026-72691-3

Link: [Open article](#)

Abstract: Abstract Direct Air Capture (DAC) is widely considered essential for achieving net-zero and net-negative emissions, yet its potential to scale to climate-relevant levels remains uncertain. Here we show that the future deployment of DAC depends primarily on early capacity expansion and growth dynamics rather than on long-term demand targets alone. Using a probabilistic technology diffusion model informed by historical analog technologies and uncertain future demand, we explore a wide range of possible global DAC deployment pathways to 2050. We find that

if DAC follows growth trajectories similar to ammonia synthesis technologies and liquefied natural gas, deployment is likely to remain at the megaton scale by mid-century. However, gigaton-scale deployment becomes plausible under rapid growth and strong early policy support. Our results identify short-term capacity expansion as the most effective lever for accelerating DAC deployment and highlight the critical importance of timely policy action to avoid overreliance on future large-scale carbon removal.

Non-cognitive skills mediate education-related polygenic score associations with academic achievement across development

2026-05-08 | Quan Zhou; Wangjingyi Liao; Andrea G. Allegrini; Kaili Rimfeld; Jasmin Wertz; Tim T. Morris; Laurel Raffington; Robert Plomin; Margherita Malanchini

DOI: 10.1038/s41467-026-72838-2

Link: [Open article](#)

Abstract: Abstract The role of environmental, developmental, and psychological processes in translating genetic dispositions into observed academic achievement remains under-investigated. Here, we examine whether non-cognitive skills-including motivation, attitudes, and emotional and behavioural functioning-mediate the genetic prediction of academic achievement across development. We analyse data from 5,016 children enrolled in the Twins Early Development Study at ages 7, 9, 12, and 16, as well as their parents and teachers. We find that non-cognitive skills mediate between less than 5 and up to 64% of the genetic prediction of academic achievement. Mediation effects are larger and more robust for motivation and attitudes (0.13) than for emotional and behavioural functioning (0.01-0.03). This pattern holds longitudinally and is replicated in within-family analyses, where non-cognitive skills account for up to 83% of the total mediation effects. These findings highlight the contribution of non-cognitive skills beyond shared familial factors, likely reflecting how children evoke and select experiences that align with their genetic propensity and lead to differences in academic development.

Systematic partisan content skews in TikTok during the 2024 US elections

2026-05-06 | Hazem Ibrahim; HyunSeok Daniel Jang; Nouar Aldahoul; Aaron R. Kaufman; Talal Rahwan; Yasir Zaki

DOI: 10.1038/s41586-026-10447-1

Link: [Open article](#)

Abstract: Abstract Social media platforms increasingly mediate political information exposure, yet the role of algorithmic curation in shaping political exposure remains contested 1,2 . This question is difficult to resolve on platforms in which users retain substantial control over their feeds 3,4 . The 'For You' feed of TikTok, which delivers

content almost entirely through algorithmic recommendation, offers a setting in which user agency is sharply constrained. Here we show, through 323 audit experiments with controlled 'sock puppet' accounts seeded with Democratic or Republican content across three US states, that accounts seeded with partisan content exhibited systematic, asymmetric differences in partisan exposure. Across more than 280,000 recommendations collected over 27 weeks during the 2024 US presidential election campaign, Republican-seeded accounts received about 11.5% more co-partisan content than Democratic-seeded accounts, whereas Democratic-seeded accounts were exposed to about 7.5% more cross-partisan content—largely anti-Democratic material—even after adjusting for engagement metrics. These asymmetries are concentrated among high-reach Republican channels and in specific policy domains, including immigration, crime and foreign policy for Democrats, and abortion for Republicans. Our findings show partisan imbalances in political information exposure on a platform dominated by algorithmic recommendations, with implications for platform governance and democratic discourse.

Observational epidemiological studies can mitigate genetic confounding with a genetic relatedness matrix

2026-05-06 | Roshni A. Patel; Joshua G. Schraiber; Matt Pennell; Michael D. Edge

Affiliations: Department of Computational Biology, Cornell University; Department of Data Science, University of Oregon; Department of Quantitative and Computational Biology, University of Southern California; Institute of Ecology and Evolution, University of Oregon

DOI: 10.1073/pnas.2533909123

Link: [Open article](#)

Abstract: Observational studies are commonly used in psychology and epidemiology to identify risk factors correlated with health outcomes. However, these studies are vulnerable to confounding when shared genetic variation influences both the putative risk factor and outcome. Researchers have often controlled for this type of genetic confounding using polygenic scores, but these scores are noisy and biased estimators of a trait's genetic component. While some newer methods offer significant improvements over polygenic scores, they still rely on genome-wide association studies (GWAS) summary statistics, which may be untenable for certain datasets. Here, we develop an analogous method that leverages a genetic relatedness matrix to control genetic confounding when testing for nongenetic risk factors. In simulations, we find that our method outperforms existing approaches, particularly at sample sizes that are large by the standards of much human research but smaller than datasets often used in human genetics. We also demonstrate that existing methods are susceptible to poor GWAS portability, whereas our method is inherently robust to such concerns, conditional on the availability of individual genotype data. Finally, we apply our method to the UK Biobank to reanalyze social risk factors for health outcomes in previously understudied cohorts.

The electoral choice context and support for democratic norms

2026-05-06 | Kang Huang; Mitchell Lovett; Gretchen Helmke

Affiliations: Department of Political Science; Simon Business School; University of Rochester

DOI: 10.1073/pnas.2521380123

Link: [Open article](#)

Abstract: In this paper, we explore whether different choice environments affect voters' willingness to put democracy over party and policy. Using a series of candidate choice experiments in which we manipulate not only candidate attributes, but also the number of races on the ballot, we find that when voters are able to vote in multiple races on a ballot they are substantially more likely to punish antidemocratic candidates than when they are only given the

opportunity to cast one vote. We refer to this effect as "democratic balancing." Substantively, our experiments show that the magnitude of the total punishment effect increases from 11% in single-race ballot settings to 17.9% in multirace ballot settings. Such effects remain largely consistent across different candidate platforms, separate waves of the survey, different types of norm violations, and are robust to different electoral race combinations and different information environments. Observational data from the 2022 U.S. midterm elections further corroborates our experimental findings. For researchers, our results underscore the importance of taking into account the institutional context in which voters make decisions. For citizens concerned with democratic backsliding, our results offer some reassurance: Moving to a more realistic electoral context in which multiple races appear on the ballot tempers the willingness of respondents to trade off democracy for their preferred policies and party.

Social cognition and interpersonal violence

2026-05-05 | Megan Kang; Kathryn Edin; Jens Ludwig; Timothy Nelson; Sendhil Mullainathan

Affiliations: Department of Economics, Massachusetts Institute of Technology; Department of Electrical Engineering and Computer Science, Massachusetts Institute of Technology; Department of Sociology and School of Public and International Affairs, Princeton University; Harris School of Public Policy, University of Chicago; National Bureau of Economic Research; School of Government and Policy, Johns Hopkins University

DOI: 10.1073/pnas.2519361123

Link: [Open article](#)

Abstract: Why do some people resort to violence while others in similar circumstances do not? Drawing on 99 in-depth interviews with men from high-violence Chicago neighborhoods who participated in a community violence intervention, we examine how past exposure to violence shapes the social cognitions that influence future involvement in violence—through the schemas and scripts people use to interpret social situations and guide behavior. We identify three specific social cognitions that respondents associated with violence: misconstruing ambiguous cues as threats, defaulting to a narrow set of behavioral responses, and attributing violent behavior to fixed personal traits rather than situational factors. Respondents reported that participation in the program's cognitive behavioral component shifted these social cognitions in ways they associated with reduced violence involvement. The consistency of these self-reports combined with the program's experimental impacts suggest the hypothesis that these specific social cognitions could play an important role in violence and may be modifiable through intervention.

Social media promotion improves job market outcomes

2026-05-04 | Jingyi Qiu; Yan Chen; Alain Cohn; Alvin E. Roth

Affiliations: Department of Economics, Stanford University; School of Information; University of Michigan

DOI: 10.1073/pnas.2528289123

Link: [Open article](#)

Abstract: Social media has transformed how academics disseminate research, but its effect on academic job outcomes remains unclear. Previous research has shown correlations between social media exposure and metrics like citation counts, but these relationships may be confounded by unobserved factors such as researcher quality or access to professional networks. We examine whether social media promotion causally affects job market outcomes in economics through a field experiment on Twitter (now X). We first collect tweets about job market papers from 519 candidates and post them from a dedicated account. We then randomize half of the posts to be quote-tweeted by established economists in the candidates' fields, and measure the effects on both online visibility and hiring outcomes. We find that posts in the treatment group receive 441% more views and 303% more likes than those in the control group. Candidates whose posts were assigned to be quote-tweeted receive one additional flyout invitation compared to the control group average of 5.4 flyouts. Furthermore, women in the treatment group receive 0.9 more job offers

than women in the control group, who receive 3 offers on average. Exploring mechanisms, we find that academic reputation drives these results, with stronger effects for quote-tweets from highly cited scholars and for candidates from top institutions. Our findings suggest social media promotion causally increases research visibility and improves academic job market outcomes.

Gains, Limits, and Side-Effects of Disinformation Interventions: Corrective Information and Self-Affirmation Assessed With Signal Detection Theory

2026-04-30 | Luisa Gehle; Christian Schemer

Affiliations: Johannes Gutenberg University, Mainz, Germany

DOI: 10.1177/00936502261442623

Link: [Open article](#)

Abstract: This study examines the effects of corrective information and self-affirmation on evaluating political claims in two contexts: the Russian invasion of Ukraine and migration to Germany. In a two-wave online experiment in Germany (N = 1,275), participants were randomly...

Theoretical Distinctions Between Emotion and Cognition Content in Supportive Messages: Examining Effects and Mediating Mechanisms

2026-04-29 | Amanda J. Holmstrom; Junwen M. Hu; Samantha J. Shebib; Jong In Lim; Yue Zhang; Andrew Bredland; Allison P. Mazur; Adam J. Mason; Amanda Allard; Josephine K. Boumis; Hailey Schulte; Ji Hyun Ha; Brooke H. Wolfe; Megan Szczypka; Ping-Hsu Wu; Yidi Zhang; Xiaoran Cui; Lu Zhang

Affiliations: Indiana University, Bloomington, USA; Michigan State University, East Lansing, USA; Texas Christian University, Fort Worth, USA; University of Alabama at Birmingham, USA; University of California, Santa Barbara, USA

DOI: 10.1177/00936502261426538

Link: [Open article](#)

Abstract: What constitutes effective supportive message content is a topic of intense interdisciplinary scholarly interest and has palpable real-world implications for individuals' well-being. Emotion and cognition content are two

commonly theorized supportive message forms. Although...

The invisible labor of assimilation by individuals with stigmatized identities: a qualitative study of autistic workers' organizational socialization

2026-04-30 | Young Ji Kim; Margot Plunkett

Affiliations: Department of Communication, University of California , Santa Barbara, CA,

DOI: 10.1093/hcr/hqag002

Link: [Open article](#)

Abstract: Abstract Organizational socialization is challenging for anyone, but especially for individuals with stigmatized identities, such as autistic people. Although the modern workforce is increasingly neurodiverse, autistic individuals continue to face persistent socialization...

The evolution of trust under institutional moral hazard

2026-05-01 | Hiroaki Chiba-Okabe; Joshua B. Plotkin

Affiliations: Center for Mathematical Biology, University of Pennsylvania; Department of Biology, University of Pennsylvania; Graduate Group in Applied Mathematics and Computational Science, University of Pennsylvania

DOI: 10.1073/pnas.2530718123

Link: [Open article](#)

Abstract: We study the behavior of an institution that broadcasts reputational signals to facilitate trust in a population. Using an online marketplace as a motivating example, we develop a theoretical model in which buyers and sellers are matched on a platform to engage in...

Uncovering how transport access reduces deprivation: When colocation misleads

2026-04-28 | Surabhi Ojha; Anupriya Anupriya; Daniel Horcher; Daniel J. Graham

Affiliations: Corvinus Institute for Advanced Studies, Corvinus University of Budapest; Department of Civil and Environmental Engineering, Imperial College London, South Kensington

DOI: 10.1073/pnas.2532730123

Link: [Open article](#)

Abstract: Since transport access determines who can reach jobs, education, healthcare, and community life, governments increasingly use accessibility improvements to reduce deprivation and tackle social exclusion. Yet whether better access causally reduces disadvantage remains...

A century of suicide: Insights from long-term data in the United States

2026-04-27 | Nina de Lacy; Wai-yin Lam; Timothy Collins; David Danks; Fernando A. Wilson; Ken R. Smith; Bernice A. Pescosolido

Affiliations: Corcoran Department of Philosophy, and School of Data Science, University of Virginia; Department of Family and Consumer Studies, University of Utah; Department of Psychiatry, University of Utah; Department of Sociology, Indiana University; Huntsman Cancer Institute, University of Utah Health Hospitals & Clinics; Huntsman Mental Health Institute, University of Utah Health Hospitals & Clinics; Irsay Institute, IU Research, Indiana University; Matheson Center for Health Care Studies, University of Utah; School of Environment, Society, and Sustainability, University of Utah

DOI: 10.1073/pnas.2519951123

Link: [Open article](#)

Abstract: The 2024 National Strategy for Suicide Prevention identifies suicide as "an urgent and growing public health crisis" driven partly by mental health and overdose rates, the COVID-19 pandemic, and declining social connectedness. Yet, data constraints have limited long-term...

Behavioral responses to wildfire smoke: Insights from smartphone location data

2026-04-27 | Clara Berestycki; M. Keith Chen

Affiliations: Anderson School of Management; Columbia University; School of International and Public Affairs; Sustainable Development Department; University of California

DOI: 10.1073/pnas.2527320123

Link: [Open article](#)

Abstract: Although wildfire smoke is a major public health concern, relatively little is known about individual avoidance behavior. In this paper, we use smartphone-location data to study behavioral responses to smoke during the 2018 California wildfire season, one of the deadliest in...

Deforestation-focused policies do not reduce degradation in the Brazilian Amazon

2026-04-27 | Federico Cammelli; Holly K. Gibbs; Florian Gollnow; Samuel A. Levy; Matthieu Stigler; Rachael D. Garrett

Affiliations: Accountability Framework initiative, Rainforest Alliance; Department of Geography and Conservation Research Institute, University of Cambridge; ETH Zurich, Department of Environmental System Science, Sustainable Agroecosystem Group, Professur für Umweltpolitik; Nelson Institute for Environmental Studies, Center for Sustainability and the Global Environment, University of Wisconsin-Madison; School of Economics and Management, University of Geneva; Stockholm Environment Institute

DOI: 10.1073/pnas.2507793123

Link: [Open article](#)

Abstract: Forest degradation causes large declines in carbon stocks, biodiversity, and ecosystem services, despite leaving some trees standing. Over the past two decades, numerous conservation policies to halt deforestation have been rolled out, but relatively little attention has...

Informal connections outweigh coauthorship ties in academic impact

2026-04-27 | Lluís Danus; William Dinneen; Carolina Torreblanca; Guy Grossman; Sandra Gonzalez-Bailon

Affiliations: Annenberg School for Communication; Department of Political Science; Stanford Law School; Stanford University; University of Pennsylvania

DOI: 10.1073/pnas.2511050123

Link: [Open article](#)

Abstract: Past work has documented the importance of formal collaboration, particularly coauthorship, in increasing research productivity and innovation. However, we know much less about how informal collaboration relates to publication success. Informal ties facilitate the exchange...

Advancing environmental sustainability research and policy in sport

2026-04-28 | Yueting Zhang; Han Hao; Yikeranmu Yi Ming; Yaomin Zhang; Bing Shi

DOI: 10.1038/s41467-026-72583-6

Link: [Open article](#)

Abstract: Sport holds profound global social influence, yet its systemic environmental footprint is often overlooked in sustainable development governance. Although environmental initiatives have proliferated in professional sport, many remain limited to public relations-fragmented,...

Associations of social isolation and loneliness with neurological disorders, psychiatric disorders, brain structures and behavioural phenotypes among UK Biobank participants

2026-04-28 | Yong-Li Zhao; Dan-Dan Zhang; Pei-Yang Gao; Yan Fu; Yi-Jun Ge; Hao-Chen Chi; Ze-Xin Guo; Hai-Hong Yu; Jian-Feng Feng; Lan Tan; Wei Cheng; Ya-Ru Zhang; Jin-Tai Yu

DOI: 10.1038/s41467-026-72529-y

Link: [Open article](#)

Abstract: Social isolation and loneliness are increasingly recognized as detrimental risk factors for brain health. Here, utilizing data from 383,421 participants in the UK Biobank, we identify significant associations between social isolation, loneliness, and the incidence of 11...

Broad spectrum structure discovery in large-scale higher-order networks

2026-04-27 | John Hood; Caterina De Bacco; Aaron Schein

DOI: 10.1038/s41467-026-71903-0

Link: [Open article](#)

Abstract: Abstract Complex systems are often driven by higher-order interactions among multiple units, naturally represented as hypergraphs. Understanding dependency structures within these hypergraphs is crucial for understanding and predicting the behavior of complex systems but is...

Hyper-RAG: combating LLM hallucinations using hypergraph-driven retrieval-augmented generation

2026-04-27 | Yifan Feng; Hao Hu; Shihui Ying; Xingliang Hou; Shiquan Liu; Mingyuan Yang; Junchang Li; Shaoyi Du; Nanning Zheng; Han Hu; Yue Gao

DOI: 10.1038/s41467-026-71411-1

Link: [Open article](#)

Abstract: Large language models (LLMs) have transformed various sectors, including education, finance, and medicine, by enhancing content generation and decision-making processes. However, their integration into the medical field is cautious due to hallucinations, instances where...

Spoken disagreement is more constructive than written disagreement

2026-04-27 | Burint Bevis; Juliana Schroeder; Michael Yeomans

DOI: 10.1038/s41467-026-71669-5

Link: [Open article](#)

Abstract: Abstract Amid rising global polarization, finding ways to disagree constructively is vital. This paper examines whether the medium of disagreement-spoken or written-shapes conversation outcomes. A series of randomized experiments (N = 1,576 conversation partners who had...
